

Tutorial: Mobile VoIP Access to Skype

(1) The user can make and receive calls using his regular mobile service provider.

(2) To make a Skype call the application first connects to a server over the cellular data channel or a WiFi network.

(3) The server instantiates a Skype client with A's credentials.

(4) The Skype client makes a Skype (or (5) SkyeOut) call to the contact B and conferences it with A's call to the server so A and B can talk together.
